Your Health Data Should Serve You, Not Profits—Because Yes, It's All

Patients, What You Should Know About Health Data Sharing and Why Transparency Matters

In today's healthcare system, one of the biggest promises is that our health information will move smoothly from one doctor or hospital to another, helping us receive better, more coordinated care. Networks like the CommonWell Health Alliance and new initiatives like **TEFCA** (Trusted Exchange Framework and Common Agreement) aim to make this vision a reality. But recent developments in health data exchange—and a troubling lack of transparency around data breaches—reveal why we need a more patient-centered approach. Patients deserve more than just promises; we deserve transparency and, ultimately, control over our own health data.

The Evolving World of Health Information Networks and QHINs

For years, networks like the **CommonWell Health Alliance** have been building systems to securely connect healthcare providers and prioritize patient needs. CommonWell, often regarded as a neutral player, focuses on linking systems in ways that serve patients without ulterior motives. Recently, CommonWell became a Qualified Health Information Network (QHIN) under the new TEFCA framework, joining other major players like Epic, Oracle Health (formerly Cerner), and Surescripts.

A QHIN, in simple terms, is a trusted, centralized hub that allows different healthcare systems to connect and securely share patient data across state lines and health networks. These networks act as "bridges" between healthcare providers, ensuring that your health information can follow you wherever you go for care. The TEFCA framework is designed to standardize data exchange across these QHINs, potentially making it

Draft - saved

easier for healthcare providers to access and share your health information.

However, the entry of large, for-profit corporations into the QHIN space raises critical questions about patient control. While CommonWell has built a reputation for neutrality, some QHINs might prioritize business interests, shifting the focus away from patient-centered care. Patients must ask: *Who really controls our data, and who benefits from it?* This is especially concerning as health data becomes a valuable asset not only for care but also for marketing and corporate profit.

The Change Healthcare Data Breach: A Cautionary Tale

To understand why patient control over health data is so crucial, consider the recent data breach at Change Healthcare, a major healthcare payment processing company. On February 21, 2024, Change Healthcare experienced a ransomware attack, compromising the sensitive health data of at least 100 million Americans. Although no one at Change Healthcare intended for this breach to occur, it happened. Yet, information about it wasn't widely publicized, and patients didn't receive immediate notification. Change Healthcare didn't begin mailing notices to affected individuals until late July—months after the initial incident. And even then, patients were left without clear guidance on what this breach meant for them or how they should protect themselves.

This delay and limited media coverage expose a serious gap in how companies communicate with patients about data security. If we aren't informed about why breaches happen or what risks we face, we're left in a vulnerable position, unable to protect ourselves. When health companies fail to communicate transparently, they not only leave us exposed but also miss an opportunity to help us understand the importance of our own data security.

Why Recent Healthcare Mergers Matter

Data breaches aren't the only risk; mergers between healthcare organizations are another concern. In recent years, we've seen a rapid increase in healthcare mergers, with many health data exchanges, technology companies, and health systems combining forces. These mergers often promise seamless, integrated care, but the reality is more complex. Merging large datasets from different organizations can create new security risks, making it easier for hackers to find vulnerabilities. And when things go wrong, it's our privacy that's at stake—not the companies'.

The effects of these mergers are real, and patients are often the ones who suffer the consequences. With each merger, our data is moved, integrated, and combined in ways we're rarely informed about. When something goes wrong, it's our privacy and peace of mind that are compromised. Patients shouldn't have to bear the consequences of these complex business moves without transparency or control over where our information goes and how it's used.

Why We Need to Be Proactive

As these shifts continue in health data sharing, it's important for patients to recognize that while these changes aim to improve data exchange, they also increase security risks. Yet, after a breach, we are often left to protect ourselves, with limited support or resources to understand what's at risk or how to respond. This makes it even more critical to stay vigilant and involved, asking who has access to our data and how it's being used.

What Can We Do?

Here are a few steps patients can take to safeguard their data and advocate for better transparency:

- **Stay Informed**: Learn about the companies and organizations that hold your health data, especially if they're involved in recent mergers or acquisitions.
- **Ask Questions**: Don't hesitate to ask your healthcare providers or health plans about their data protection measures. You have a right to know how your data is managed and secured.
- **Advocate for Transparent Communication**: Patients deserve prompt, honest updates if their information is compromised. Insist on transparency from the companies that hold your data.
- **Support Data Privacy Legislation**: Stay informed about and support legislation aimed at protecting patient data. The Health Insurance Portability and Accountability Act (HIPAA) provides some safeguards, but it's worth pushing for updated protections as technology advances.

Moving Forward: Why Patient Control Matters

These ongoing changes in health data sharing highlight why patients need control over their data. Imagine being able to access your health records whenever you want, choose who can see them, and understand exactly how they're used. When we have this level of control, we're empowered to make choices that align with our needs and values—not a company's bottom line. This isn't just about convenience; it's about protecting our privacy, our peace of mind, and our right to make decisions about our health.

We're all patients at some point—whether it's us, our children, our parents, or someone we care deeply about. We deserve a system that values transparency, respect, and the right to control our own health data. Imagine a future where patients aren't just passive participants but active managers of their health information, empowered to protect themselves and their loved ones.

As the landscape of health data sharing continues to evolve, staying informed and advocating for our own privacy is more important than ever. The future of healthcare should be one that empowers patients—not just providers and corporations.

After all, we should be the ones writing the story of our own health—because yes, it really *is* all about you!
