Summary Problem

75% of patients do not take their meds correctly which causes 125,000 deaths and $290 billion in added costs. The cost of the US opioid epidemic is $2.7 trillion with 100,000 overdose deaths. 44 Veterans die of suicide/opioid overdose every day. The 206 VA clinics that treat 6,600 veterans cannot handle the 418,000 Veterans who need opioid use disorder (OUD) treatment. We have OUD medications to treat OUD and reduce the overdose death by greater than 50% but patients cannot access them due to barriers to care. Many turn to Heroin and Fentanyl which results overdose deaths, crime, homelessness, and unemployment. The cycle has repeated itself for the past 25 years. We need a change

Solution and Features

iPill ecosystem features:

- A secure dispenser prefilled with opioids or OUD meds
- delivered directly to Vets' homes
- secure biometric controlled home storage of meds
- precise dispensing at home so only the prescription holder can access meds at only the prescribed schedule
- remote medication adherence monitoring to detect missed daily doses in real-time
- Alerts to family, friends, caregivers to remediate missed meds
- destruction of unused pills at 30 days or immediately if tampered to prevent abuse,, diversion or accidental overdose
- remote vital sign monitoring via smart phone faceprint
- telehealth for remote psychosocial support

Competitive Advantage

iPill is the first integrated pill dispenser delivered to the home to monitor both patients and pills. IPill provides holistic treatment with psychosocial support of the "mind" via telehealth and "physical" support with meds via precise home dispensing. Because iPill destroys unused pills at 30 days or immediately if tampered, it can be used to prevent misuse, diversion, and accidental overdoses. Further, because any shape or size of pills can be used in the iPill, it has multiple customers and multiple revenue streams including jails, OUD clinics, VA, Contract Research organizations (CROs) and specialty pharmacy for HIV drugs, cancer drugs, or transplant drugs and sedatives, tranquilizer, and stimulants. Most significantly, iPill is avoiding reliance on commercial insurance for revenue. Upfront funds from opioid litigation settlement, VA, and direct payment from specialty pharma ensures promising returns for the discerning investor.
