RE: Request for Information; Health Technology Ecosystem (RIN: 0938-AV68)

Dear Administrator Oz,

Glytec appreciates the opportunity to respond to the Centers for Medicare and Medicaid Services' (CMS) Request for Information regarding strategies to strengthen the digital health ecosystem. We commend CMS for its leadership in promoting innovation and quality improvement through technology-enabled solutions.

About Glytec

Since our founding in 2006, Glytec has been a pioneer in insulin management technology. We provide advanced insulin management software as a medical device (SaMD) cleared by the Food and Drug Administration, capable of delivering personalized insulin treatment across the entire range of inpatient glycemic care. Glytec's software uses peer-reviewed medical guidelines further supported by advanced intelligent computer-based algorithms for administering insulin to optimally direct glycemic management under a number of different clinical conditions and severities, environments, and challenges. These include diabetic and nondiabetic (*e.g.*, stroke, ICU, CABG pts, etc.) patients, as well as complex clinical presentations such as diabetic ketoacidosis, hyperosmolar coma, and varying dietary intake.

Our solutions have demonstrated meaningful improvements in safety, efficacy, and cost savings for over 350 health systems nationwide – including academic medical centers, community hospitals, accountable care organizations, and health plans. Recognizing that 40 to 50 percent of patients in some hospitals require insulin, health systems are increasingly relying on SaMD to improve glycemic management. Our clients have realized measurable reductions in hypoglycemia, hyperglycemia, length of stay, readmissions, A1C levels, and overall cost of care. By optimizing glycemic control, Glytec delivers not only clinical but significant economic value across a number of domains to patients and hospital operations.

As a leading health care technology company, we appreciate the opportunity to share our experience and insights and welcome continued collaboration with CMS to ensure digital health tools like ours are seamlessly integrated into the health care system to support providers, enhance patient outcomes, and drive value-based care.

Drive the development and adoption of digital health management and care navigation applications

Glytec applauds CMS for examining policies to accelerate the adoption of SaMD across the health care system. These technologies have the potential to significantly improve patient care, reduce preventable harm, and lower costs by streamlining clinical workflows and enabling more precise, data-driven decision-making. SaMD has an increasingly important role in health care, and mechanisms to financially incentivize its adoption should be an important focus of policy change.

Outcomes-based incentives that align financial rewards with patient outcomes are essential for the widespread adoption of digital health tools. For example, last August, CMS released its fiscal year (FY) 2025 Inpatient Prospective Payment System/Long-Term Care Hospital Prospective Payment System final rule, which required hospitals to report on both the Severe Hyperglycemia and Hypoglycemia electronic clinical quality measures (eCQMs) beginning with the calendar year 2026 Reporting Period/FY 2028 Payment Determination. CMS' inclusion of the new eCQMs created a meaningful incentive for hospitals to invest in tools that improve glycemic management. By tying performance on these measures to public reporting and potential financial rewards or penalties, CMS is driving the adoption of SaMD, which helps providers deliver safer, higher-quality care.

Since the rule was finalized, digital platforms like Glytec's Glucommander are increasingly used by hospitals to standardize insulin therapy, reduce adverse glycemic events, and align with performance expectations. These tools support clinical teams by automating insulin dosing, reducing reliance on manual protocols, and enabling proactive intervention when patients are outside of target glucose ranges. In doing so, they improve patient outcomes, reduce health care costs, and help hospitals succeed under value-based reimbursement models where glycemic control is a key indicator of quality and safety.

Tools like Glucommander are helping progress insulin management from simple insulin use to insulin dosing schedules to paper-based "sliding scale" systems, on to now tightly managed, algorithmically based systems that optimize care, minimize the chances of patient harm, and improve economic management. Our program tracks all values longitudinally, presents the results graphically, and is accompanied by monitored analytic metrics. This detailed support can be refined for hospital floor units, clinical committees, and hospital medical executives for system-level quality initiatives.

We encourage CMS to continue advancing outcomes-based models, particularly those that reward effective glycemic management. By aligning incentives with performance on measures like severe hyper and hypoglycemia, CMS can drive broader adoption of clinically validated SaMDs that support insulin safety, reduce preventable harm, and alleviate provider burden. Sustained investment in these models will not only improve outcomes for patients with diabetes but also support hospitals in delivering more efficient, cost-effective care.

Reduce administrative burden while accelerating progress toward value-based, patient-centered care

Administrative burden continues to drive provider burnout and inefficiency in care delivery. When properly implemented, digital health tools can offer a powerful means of streamlining documentation and simplifying workflows to reduce the administrative burden on clinicians. For example, Glytec's software significantly reduces provider burden by automating the complex, time-consuming process of insulin titration.

Traditionally, insulin titration requires clinicians to manually assess blood glucose trends, calculate insulin doses, and adjust therapy based on evolving patient needs, often using paper protocols or spreadsheets. Leveraging Glytec's Glucommander system, clinicians receive real-time, personalized dosing recommendations based on each patient's unique glucose trends and clinical status. The platform also generates alerts when a patient's glucose levels fall outside the target range, giving clinicians confidence they will not miss critical events. These efficiencies save valuable clinician time, reduce cognitive load, and support safer, more consistent glycemic management across the care team.

By leveraging tools like Glucommander, CMS can reduce documentation fatigue, support safer clinical decision-making, and allow providers to focus more fully on patient-centered care. We appreciate the opportunity to provide feedback and thank you for your leadership on these important issues.

Sincerely,

DocuSigned by:
