A Certified Developer Ecosystem for Personalizing Addison Care

Electronic Caregiver is positioned to launch a powerful new extension of its AWS-certified ADDI Platform-as-a-Service (PaaS) by opening a Developer Marketplace that enables third-party developers to build and monetize features for the Addison Care experience within a secure, compliant, and curated environment.

This expansion leverages the existing RESTful API infrastructure and core PaaS services to allow certified partners to integrate directly with Addison's 3D interactive avatar, scene engine, and health automation framework - dramatically accelerating innovation, driving revenue growth, and enhancing the personalization of care delivery.

STRATEGIC BENEFITS

1. Accelerated Innovation Through 3rd-Party Development

- Extend Addison's capabilities across specialty conditions, behavioral wellness, cultural preferences, engagement modules, and emerging care protocols without consuming internal R&D cycles.
- Developers build once on the ADDI PaaS, with sandbox environments and API access governed by certification protocols.

2. New High-Margin Revenue Streams

- Monetize premium features as add-ons, monthly upgrades, or enterprise enablement tools.
- ECG benefits from revenue share, platform fees, and developer tier subscriptions.

3. Enterprise Value Uplift: Platform vs. Product

- Elevates Addison from a product to a customizable ecosystem, increasing valuation multiples.
- Creates long-term stickiness by embedding partners, developers, and enterprise clients deeper into the platform.

4. Increased Personalization & User Control

- Users (or caregivers) can enhance Addison through an in-app menu:
  - New games for cognitive health
  - Language or faith-based routines
  - Expanded vitals and disease-specific care modules
  - Virtual seasonal themes, music, voice packs, and scenes

CORE ARCHITECTURE (Built on ADDI PaaS)

Component Functionality

Component	Functionality
ADDI RESTFUL APIs	Expose avatar, scene, speech, monitoring, scheduling, care plan functionality
Developer Sandbox	Safe testing environment integrated into ECG infrastructure
App Certification Workflow	Security, compliance, performance, and content review process
Developer Portal	Docs, SDKs, APIs, usage dashboards, payment systems, deployment tools
Addison Storefront UI	Consumer and enterprise menu to browse, install, and manage add-ons

WHAT DEVELOPERS CAN BUILD

Category	Example Modules
Health Add-Ons	COPD support routines, mobility exercises, personalized meal coaching
Gamification	Daily wellness challenges, memory games, hydration trackers
Cultural UX	Language localization, holiday themes, faith-based prompts
Professional Tools	Care team dashboards, assessment overlays, telehealth specialty extensions
Lifestyle Tools	Grocery ordering, pharmacy reordering, ride scheduling, in-home service triggers

GOVERNANCE & CERTIFICATION

- All third-party add-ons must pass:
  - HIPAA & security screening
  - Performance validation on target devices
  - Content and brand alignment review
- ECG retains complete control over platform access, category restrictions, and deprecation rights.

MONETIZATION STRUCTURE

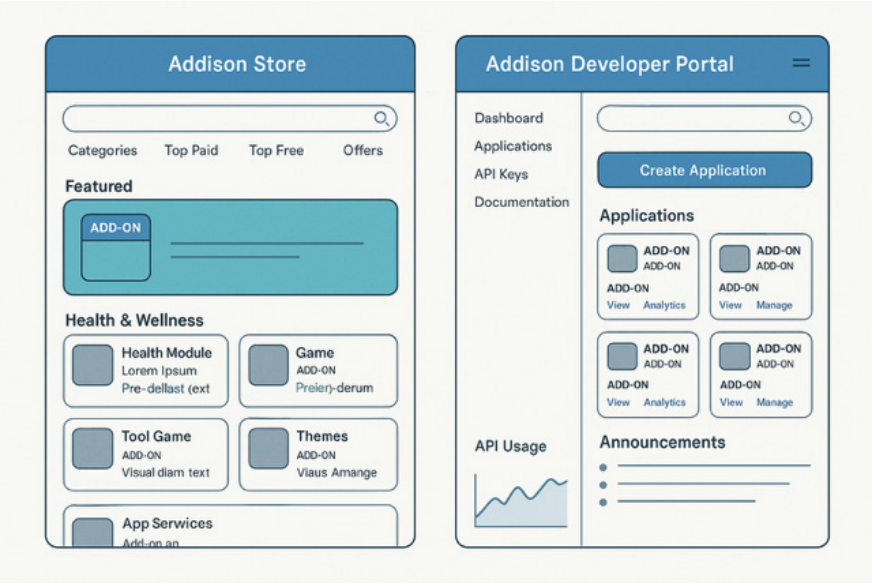
Revenue Stream	Mechanism
Rev Share on Add-ons	ECG takes % of one-time or recurring in-app sales
Subscription Tiers	Developer access to tools, priority support, analytics
Promotion Fees	Paid placement within the Addison interface
API Usage Fees	For high-frequency or resource-intensive integrations

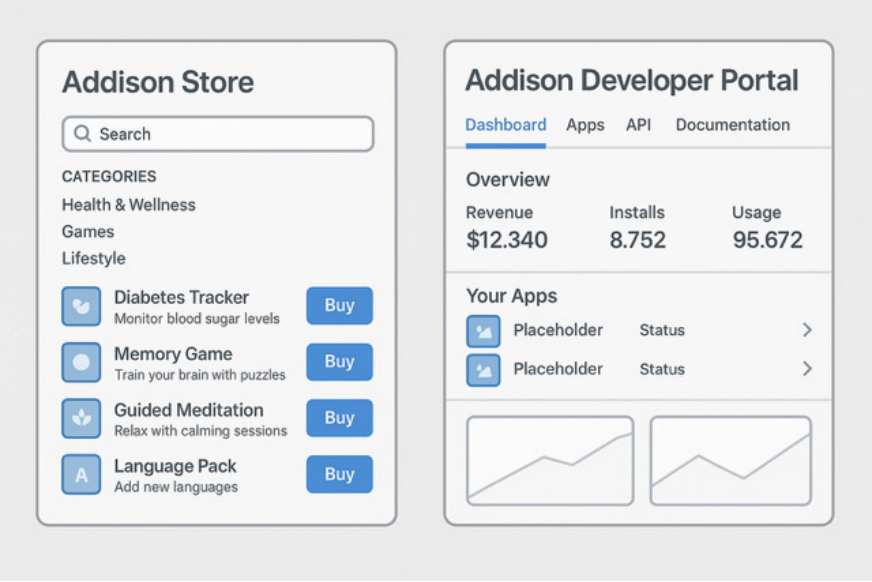
LAUNCH ROADMAP (Future Phases to Develop)

1. **Internal Scope & Pilot**
   Launch beta SDK with trusted partners and internal modules.

2. **Developer Portal + Docs**
   Stand up developer tools within the ADDI PaaS ecosystem.

3. **Initial Partner Program**
   Recruit 20–50 certified developers for the showcase launch modules.

4. **Public Launch**
   Activate in-app Addison Storefront + ongoing ecosystem management




EXAMPLES:
