

Department of Health and Human Services (HHS)
in collaboration with the Assistant Secretary for Technology Policy (ASTP) and the
Office of the National Coordinator for Health Information Technology (ONC)

Request for Information (RFI)
Accelerating the Adoption and Use of Artificial Intelligence (AI) as Part of Clinical Care
RIN 0955-AA13

Submitted via Regulations.gov

Prepared by: InterSystems
Point of Contact: Zach Keating | pr@intersystems.com

InterSystems appreciates HHS's Request for Information and the Department's intent to use regulation, reimbursement, and research & development levers to accelerate adoption and use of AI in clinical care. We agree with HHS that progress requires a forward-leaning, industry-supportive approach that also preserves privacy, confidentiality of identifiable health information, and public trust.

AI adoption at scale will depend on interoperability as infrastructure: consistent access to high-quality, standardized data; predictable security and governance; and repeatable implementation patterns across settings and vendors. As an interoperability platform vendor operating across heterogeneous environments, InterSystems recommends HHS prioritize actions that (1) expand discrete, standards-based data access for core clinical workflows and public health/quality use cases, (2) reduce variability and integration burden, and (3) strengthen trust through security, provenance, and auditability.

HHS indicates it seeks a regulatory posture that enables innovation while protecting patients and the confidentiality of identifiable health information and maintaining public trust. InterSystems recommends HHS prioritize clarity in three areas:

- **Accountability and auditability for AI in clinical workflows:** Encourage requirements for logging and traceability (inputs, outputs, downstream actions) appropriate to clinical risk.
- **Provenance expectations:** Promote use of provenance/attribution so clinicians and organizations can understand what data informed AI outputs.

- Interoperability guardrails for AI integration: Avoid creating “AI-only” proprietary side channels for clinical context exchange. AI integration should remain anchored to core interoperability standards and established security controls.

InterSystems appreciates the opportunity to respond to this RFI and supports HHS’s objective to accelerate AI adoption in clinical care using regulation, reimbursement, and R&D levers. InterSystems encourages HHS to treat interoperability as the enabling infrastructure for AI - pairing standards-based data access with strong security, provenance, auditability, and practical implementation guidance so AI can be deployed safely and consistently across heterogeneous healthcare environments.
